AP20 Rec'd PCT/PTO 09 FEB 2006
ABSTRACT

A coffee maker includes a base, a lower portion of a body, an upper portion-of the body, a heater, and a water pipe. The base is placed at the bottom of the coffee maker and connected to the lower portion of the body through screws. The base has a supporter by which a coffee cup can be supported. The upper portion of the body comprising a water tank, a lid, an infusing house and a flow distributor, is placed on the top of the body. The coffee maker also includes an actuating mechanism, which allows the upper portion of the body to move up or down. Upon the height of the coffee cup placed at the supporter, by turning a knob of the actuating mechanism, the upper portion of the body may be adjusted to prevent coffee from spaying out from the coffee cup.
